Experience

MyClone (formerly Rappo)

Founding Full-Stack Engineer

August 2025 – April 2026

Remote (US) | myclone.is

- Built a real-time voice-cloning agent with LiveKit, optimizing the voice pipeline for low latency and concurrent sessions.
- Developed a context-aware RAG system with LlamaIndex and used Langfuse tracing to monitor LLM latency, performance, and response quality.
- Established LLM observability with Langfuse and production error tracking and alerting with Sentry.
- Managed AWS infrastructure with Terraform, executed PostgreSQL migrations, and built role-based access-control systems.
- Delivered a complete production-ready product rebuild in four weeks during a company pivot.
- Led a three-person remote engineering team, ran daily stand-ups, and coordinated technical decisions and the product roadmap with the founder.

Rappo (now MyClone)

Founding Full-Stack Engineer

January 2025 – August 2025

Remote (US)

- Architected a Cal.com scheduling system handling end-to-end booking workflows for 100+ weekly appointments.
- Built a recommendation cron service processing 40+ startups every two weeks and delivering 800+ targeted recommendations monthly.
- Integrated Dyte video communications and automated transcript processing for post-meeting analytics.

Aereo (formerly Aarav Unmanned Systems)

Software Engineer I

January 2022 – December 2024

Bengaluru, India | aereo.io

- Developed front-end data-visualization charts that received positive customer feedback.
- Created interactive 3D and 2D geospatial maps using Cesium.js and OpenLayers.
- Refactored backend services, reducing the codebase by 40–50% while improving performance and scalability.
- Designed custom solutions for efficient storage and handling of geospatial data.
- Implemented automated end-to-end and front-end unit testing, reducing production bugs by 60%.
- Integrated GitLab CI/CD pipelines to automate development workflows and accelerate deployment.

Projects

toydb – Read-Only SQLite Implementation in Rust

Independent Database Internals Project

In Progress

github.com/vaibhav135/toydb

- Built a read-only SQLite implementation from first principles in Rust that reads standard SQLite database files directly without using SQLite as the query engine.
- Implemented database-header and `sqlite_schema` parsing, SQLite record serial types, text encodings, overflow-page chains, and interior/leaf table and index B-tree pages.
- Built B-tree-directed table scans and indexed equality lookups using index B-tree → rowid → table B-tree traversal, avoiding sequential scans of unrelated database pages.
- Implemented a focused `SELECT` query path with column projection and equality predicates, plus an interactive REPL with `.dbinfo` and `.tables` commands.

Open Source Contributions

- Meilisearch** – Contributed to the mini-dashboard project to improve the overall UI/UX.
- Layer5** – Added UI features and fixed critical bugs across Meshery, Meshery Cloud, and MeshMap.

Technical Skills

Languages: Rust, Go, TypeScript, Python, JavaScript

Frameworks & Libraries: React.js, Next.js, Node.js, FastAPI, Django, LlamaIndex, LiveKit, Dyte, Langfuse, Huma API, Redux, Jest, Playwright, Pytest

Infrastructure & Tools: Docker, AWS, Terraform, Sentry, Git, PostgreSQL, MongoDB, Linux, CI/CD

Education

University of Delhi

B.Sc. (Hons.) Computer Science

August 2018 – August 2021

Delhi, India
